**Anabolic Amino Acid Complex**

**Clinical Applications**

- Supports Muscle Protein Synthesis in the Young and the Elderly*
- Supports Muscle Recovery After Exercise*
- Supports Muscle Strength and Function*

**Discussion**

The amino acid (AA) formula that comprises XymoBolx was meticulously developed and studied by internationally recognized researchers in the fields of muscle metabolism and aging and longevity. Seventeen years of research have resulted in this particular blend of the nine essential amino acids (EAAs)—including the branched-chain amino acids leucine, isoleucine, and valine—plus arginine, proportioned in the most optimal ratios for muscle anabolism.  

XymoBolx is designed for both young and elderly individuals who are seeking to stimulate muscle protein synthesis, hasten muscle recovery, and promote muscle strength and function.*

**Quality Not Quantity**

Amino acids are potent stimulators of muscle protein synthesis in both the young and the elderly. Of the AAs, data indicate that EAAs are primarily responsible for this biological process.** Moreover, studies demonstrate that there is no additional benefit to muscle protein synthesis from adding non-essential AAs to an EAA supplement.*** In fact, the addition of 22 g of non-essential AAs to 18 g of EAAs produced no additional benefit to net muscle balance when compared to the provision of 18 g of EAAs alone.** Likewise, a 15 g EAA supplement—with the nine EAAs in similar ratios to XymoBolx—had twice the impact on muscle protein synthesis than that of an equal amount (15 g) of a high-quality protein.*

**Why Include Arginine?**

In healthy young adults, sufficient arginine can be synthesized to meet normal demands. However, during rapid growth or in response to stress, there are heightened needs for arginine that may not be fully met. Furthermore, there is evidence that arginine has a unique stimulatory effect on muscle protein synthesis. While all mechanisms have not been fully elucidated and are likely multifactorial, it is known that arginine converts to nitric oxide, which relaxes blood vessels and improves blood flow to muscles. Last, arginine availability influences its own catabolism and that of other amino acids by controlling urea genesis. A critical finding that solidified the need to add arginine to the EAA formulation was that without it, plasma arginine decreases; therefore, the rate of protein synthesis is potentially reduced.*

**Essential Amino Acids and Exercise**

The effectiveness of EAA intake is amplified by ingestion before exercise because of the increased delivery of amino acids to the muscles.** In fact, results from acute studies have shown that exercise and EAA intake have additive effects on muscle protein synthesis.*** Furthermore, branched-chain AAs (BCAAs), have been demonstrated to hasten post-exercise muscle recovery. Data show that BCAA (e.g., leucine) supplementation before and after exercise helps decrease exercise-induced muscle damage, promotes muscle protein synthesis, and modulates exercise-related cytokine production.** For example, leucine-enriched EAA supplementation (total EAA was 10 g of which 1.85 g were leucine) prolonged the anabolic response and the sensitivity of skeletal muscle to AAs.**

**In the Elderly**

Protein supplements are often used to help ward off muscle-related losses in the elderly. According to Ferrando et al., *Increasing protein intake to 1.4 kg/d in the elderly with EAA supplementation indicates the potential for preserving muscle function.* Because non-essential AAs are not as effective as EAAs for muscle anabolism, supplements containing significant calories in the form of non-essential AAs may be inadequate to maximize anabolic efficiency in the elderly.** Furthermore, the elderly tend to use protein supplements as calorie substitutes and reduce their food intake.** In these cases, it becomes critical that the AA supplement be low-calorie, so as not to influence satiety, and highly efficient to confer maximum benefits to skeletal muscle.** A high proportion of leucine is another factor that is required for optimal stimulation of muscle protein synthesis in the elderly.** Additionally, there is evidence that the presence of carbohydrates in a nutritional supplement for the elderly is not beneficial and may actually impair muscle anabolism.** XymoBolx is a highly efficient blend of EAAs plus arginine that provides zero carbohydrates.*

*XymoBolx represents a breakthrough in the use of amino acids for muscle protein synthesis. Over 20 human trials have been conducted to arrive at this specific, patent-pending combination of amino acids in the most effective, anabolic ratios. Whether you want to support muscle strength and function or prevent muscle loss associated with inactivity or aging, XymoBolx provides the right amino acids in the right ratios to help you meet your goals and stay healthy.*

**Daily Value not established.**

**Other Ingredients:** Citric acid, malic acid, natural flavors (no MSG), sea salt, stevia, and riboflavin (for color).

**DIRECTIONS:** Dissolve one scoop (6.8 g) into 8-12 oz of room-temperature water and consume once per day between meals, or as directed by your healthcare practitioner. Consult your healthcare practitioner prior to use. Individuals taking medication should discuss potential interactions with their healthcare practitioner. Do not use if tamper seal is damaged.

**STORAGE:** Keep closed in a cool, dry place out of reach of children.

**DOES NOT CONTAIN:** Wheat, gluten, yeast, soy, animal or dairy products, fish, shellfish, peanuts, tree nuts, ingredients derived from genetically modified organisms (GMOs), artificial colors, artificial sweeteners, or artificial preservatives. Does not contain artificial colors.

**DOES NOT CONTAIN:** Wheat, gluten, yeast, soy, animal or dairy products, fish, shellfish, peanuts, tree nuts, ingredients derived from genetically modified organisms (GMOs), artificial colors, artificial sweeteners, or artificial preservatives.
